Non linear data/function

- Does this data points seem familiar matching a known function?

Non linear data/function

- Does this data points seem familiar matching a known function?

- A Sinusoidal function

$$y(t) = A \sin(\omega t + \varphi) = A \sin(2\pi f t + \varphi)$$

Non linear data/function

- Does this data points seem familiar matching a known function?

- A Sinusoidal function

$$y(t) = A \sin(\omega t + \varphi) = A \sin(2\pi f t + \varphi)$$

Clearly this is not a linear function; right?

Non linear data/function

- Does this data points seem familiar matching a known function?
- Can we approximate this function using LR?

$$\hat{y} = \beta_0 + \beta_1 x$$

LR will not work; right?

What no-linear functions we are aware of?

- Can you recall any nonlinear function you learned at your high school/colleges?

What no-linear functions we are aware of?

- Can you recall any nonlinear function you learned at your high school/colleges?
- **Quadratic (x^2)**

$$f(x) = x^2, \quad f(x) = 2x^2, \quad f(x) = 5x^2.$$

What is the impact of changing the coefficient of x^2 as we have done in these examples? One way to find out is to sketch the graphs of the functions.

What no-linear functions we are aware of?

- Can you recall any nonlinear function you learned at your high school/colleges?
- **Cubic (x^3)**

What no-linear functions we are aware of?

- Can you recall any nonlinear function you learned at your high school/colleges?
- Quadratic (x^2)
- Cubic (x^3)
-

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3 + \dots$$

Linear (x)

Quadratic (x^2)

Cubic (x^3)

LR to Polynomial Regression

- Polynomial function
 - M is the order/degree of polynomial ..

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3 + \dots$$

LR to Polynomial Regression

- Polynomial function
 - M is the order/degree of polynomial ..
 - **Where to stop? What is the best M ?**

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3 + \dots$$

LR to Polynomial Regression

- Polynomial function
 - M is the order/degree of polynomial ..
 - **Where to stop? What is the best M ?**

Good news is our gradient descent (iterative learning) remains the same!

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3 + \dots$$

LR to Polynomial Regression

- Polynomial function
 - M is the order ..
 - **Where to stop? What is the best M?**

- Good news is our gradient descent (iterative learning) remains the same!
- You only need to change your objective function (from LR to Polynomial LR)

$$\hat{y} = \beta_0 + \beta_1 x$$

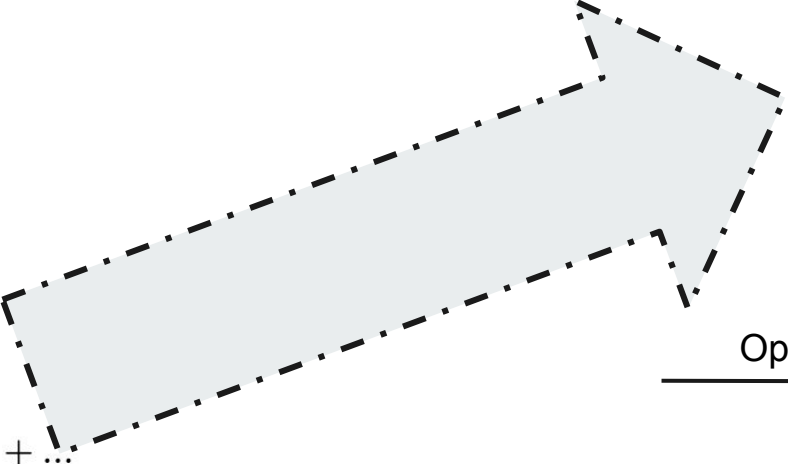

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3$$

$$\hat{y} = \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_3 x^3 + \dots$$

LR to Polynomial Regression

$$\begin{aligned}\hat{y} &= \beta_0 + \beta_1 x \\ \hat{y} &= \beta_0 + \beta_1 x + \beta_2 x^2 \\ \hat{y} &= \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_2 x^3 \\ \hat{y} &= \beta_0 + \beta_1 x + \beta_2 x^2 + \beta_2 x^3 + \dots\end{aligned}$$

Model

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\Theta = \{\beta_0, \beta_1\}$$

$$\epsilon = |\hat{y} - y|$$

Optimization function

$$E_{\Theta} = \frac{1}{2} \sum_{i=1}^N (\hat{y}_i - y_i)^2$$

$$\Theta^* = \operatorname{argmin}_{\Theta} E\{(x_i, y_i)\}_{i=1, \dots, N}$$

Our model got a little bigger: 2 params to M param

GPT

I know one of your tricks; get you soon!!

Our model yesterday

Our model got a little bigger: 2 params to M param

GPT

I know one of your tricks; get you soon!!

Our model today

Regularization

Regularization

So, essentially we are fitting a function; right?

Model

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\Theta = \{\beta_0, \beta_1\}$$

Fitting Error

$$\epsilon = |\hat{y} - y|$$

Optimization function

$$E_{\Theta} = \frac{1}{2} \sum_{i=1}^N (\hat{y}_i - y_i)^2$$

$$\Theta^* = \operatorname{argmin}_{\Theta} E\{(x_i, y_i)\}_{i=1, \dots, N}$$

Regularization

$$E(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^N \{y(x_n, \mathbf{w}) - t_n\}^2$$

Same model, two different notations

Model

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\Theta = \{\beta_0, \beta_1\}$$

$$\epsilon = |\hat{y} - y|$$

Optimization function

$$E_{\Theta} = \frac{1}{2} \sum_{i=1}^N (\hat{y}_i - y_i)^2$$

$$\Theta^* = \operatorname{argmin}_{\Theta} E\{(x_i, y_i)\}_{i=1, \dots, N}$$

Regularization

$$E(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^N \{y(x_n, \mathbf{w}) - t_n\}^2$$

Essentially, the same formulation

Generally **ML** vs **Math** conventions

Model

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\Theta = \{\beta_0, \beta_1\}$$

$$\epsilon = |\hat{y} - y|$$

Optimization function

$$E_{\Theta} = \frac{1}{2} \sum_{i=1}^N (\hat{y}_i - y_i)^2$$

$$\Theta^* = \operatorname{argmin}_{\Theta} E\{(x_i, y_i)\}_{i=1, \dots, N}$$

Regularization

$$E(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^N \{y(x_n, \mathbf{w}) - t_n\}^2$$

x : scalar
 \mathbf{x}, \mathbf{x} : vector
 \mathbf{X} : Matrix

Model

$$\hat{y} = \beta_0 + \beta_1 x$$

$$\Theta = \{\beta_0, \beta_1\}$$

Essentially, the same formulation

Generally ML vs Math conventions

$$W^* = \operatorname{argmin}_W E\{(x_i, t_i)\}_{i=1, \dots, N}$$

$$\epsilon = |\hat{y} - y|$$

Optimization function

$$E_{\Theta} = \frac{1}{2} \sum_{i=1}^N (\hat{y}_i - y_i)^2$$

$$\Theta^* = \operatorname{argmin}_{\Theta} E\{(x_i, y_i)\}_{i=1, \dots, N}$$

Regularization

Table 1.1 Table of the coefficients w^* for polynomials of various order. Observe how the typical magnitude of the coefficients increases dramatically as the order of the polynomial increases.
